

The berm and riparian zone around the wetland will be seeded with Red Top Grass and Meadow Fescue. Islands will be seeded with the same mixture. The mixture will, in both cases, be 50/50 at a rate of 35 lbs/acre. Clusters of shrubs will be established on banks and islands. Shrubs will be planted on 8 foot centers in clusters of three. Shrub species will include Alder, Wax Myrtle, Black Willow, and Elderberry. These shrubs are frequently found growing together and can tolerate the same or similar conditions. Black Willow will be used to stabilize the channels leading into and away from the mitigative wetland areas.
